“Revolutionizing Agriculture with Agri edge or Manage Ltd: A Salesforce - driven Order Management Solutions”

Submitted by:

Nandhini priya S
Rishika L
Rohini S
Vinnazhagi L

Overall Implementation:

AgriEdge Or-Mange Ltd aims to enhance agricultural supply chain efficiency using Salesforce.
This project focuses on optimizing order processing, inventory management, farmer
support, and automated workflows to ensure seamless operations in the agriculture sector.
1. Salesforce CRM Implementation
2. Process Automation & Workflows
3. Apex & Trigger Implementations
4. Batch Jobs & Scheduled Processes
5. Data Security & Access Control

INTRODUCTION

Agriculture is one of the most critical sectors but often suffers from inefficiencies such as manual order handling, lack of transparency, and poor communication among stakeholders.

AgriEdge addresses these challenges by implementing a Salesforce-based Order Management System (OMS) that:

- Connects farmers, suppliers, and buyers on a single platform
- Automates order lifecycle (creation → processing → delivery)
- Provides real-time insights and reporting
- Enhances productivity and reduces delays

This digital transformation empowers agricultural businesses to scale efficiently and operate with greater accuracy.

Overview:

AgriEdge Order Management Ltd aims to transform traditional agricultural supply chain processes using Salesforce technology. The

project focuses on digitizing and automating order management, improving communication between farmers, distributors, and retailers, and ensuring transparency across the supply chain.

- By leveraging Salesforce, the solution provides:
- Centralized data management
- Real-time order tracking
- Automated workflows
- Improved customer experience

This helps reduce manual errors, increase efficiency, and support data-driven decision-making in agriculture.

IDEATION PHASE:

Problem statements :

PS	**I am customer**	**I'm trying to**	**But**	**Because**	**Which makes me feel**
PS -1	Sales Representative	Process bulk seed and fertilizer order from remote farm	I often lose order data and duplicate entries	My current system is paper based and lacks offline sync	frustrated and unprofessional
PS -2	Warehouse manager	Coordinates timely delivery of perishable agro chemicals	Deliveries are frequently delayed or sent to wrong locations	We lack real time GPS tracking and automated routing in our CRM	Stressed and overwhelmed

PS-3	Finance team	Track the status of my equipment and supply orders	I have no visibility into when my items will arrive	There is no automated customer portal or SMS notification system	Anxious and neglected

Requirement Phase :

A. System Requirements

Software Requirements

- Salesforce CRM platform
- Web browser (Chrome, Edge, etc.)
- APIs for payment gateway and SMS services

Hardware Requirements

- Smartphone / Computer
- Stable internet connection

B. Data Requirements

- Customer details
- Farmer details
- Product information
- Order records
- Payment details

C.Functional Requirements

These describe what the system should do.

- User Management
  - User registration and login
  - Role-based access (Admin, Farmer, Distributor, Customer)
- Order Management
  - Create and manage orders
  - View order history
  - Update order status (Pending, Confirmed, Shipped, Delivered)

- Inventory Management
  Track product availability
  Alert for low stock
- Payment Integration
  Support online and offline payment methods
  Generate invoices
  Notifications
- SMS/Email alerts for order updates
- Delivery notifications
- Reports and Dashboard
- Sales reports
- Order analytics

D.Non-Functional Requirements

These define system quality and performance.
Performance

- System should handle multiple users simultaneously
  Fast response time (< 3 seconds)
- Security
- Data encryption
- Secure login authentication
- Role-based access control
- Scalability
- Ability to support increasing users and data
- User-friendly interface
- Mobile-compatible design
- System uptime of at least 99%
- Backup and recovery mechanism

Project planning

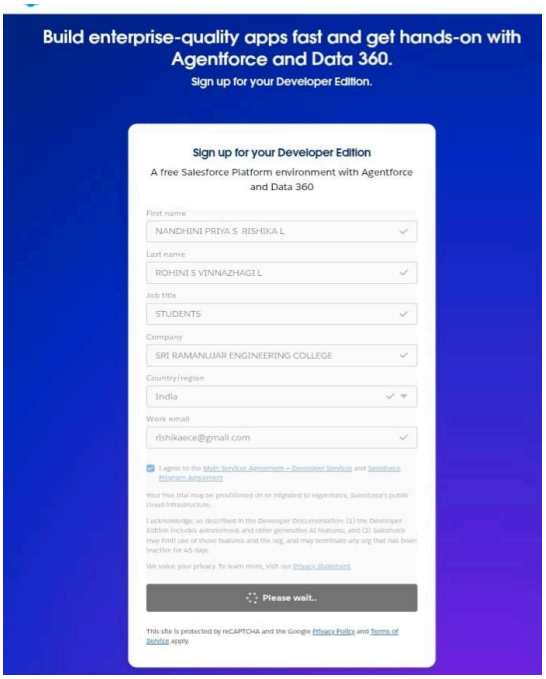
- The project followed an **Agile-based development approach** with defined milestones and sprints focused on agricultural supply chain needs.
- A **Salesforce Developer** account was created to set up the specialized AgriEdge development environment.
- **Custom objects** were designed to store Farmer (Customer), Crop Cycle, and Agricultural Product data.
- **Custom tabs and a Lightning Application** (AgriEdge Console) were developed for easy navigation in the field and office.
- **Fields, relationships, and global picklists** were configured to ensure data consistency across different farm regions.
- **Page layouts and record types** were created based on user roles such as Field Sales Agents and Supply Chain Managers.
- **Validation rules** were implemented to prevent incorrect data entry, such as negative inventory counts or invalid farm locations.
- **Email templates and automated flows** were developed for order confirmations and delivery status updates to farmers.
- **Reports and dashboards** were created for real-time tracking of sales performance and supply distribution.
- **Regular sprint reviews and testing** were conducted to track progress and resolve issues related to mobile data entry.

Project Development Phase:

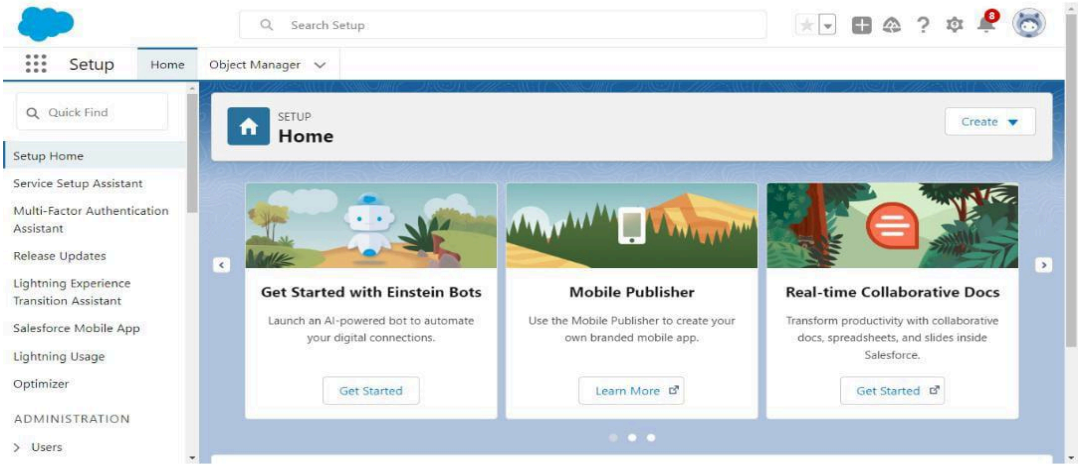
Project Flow

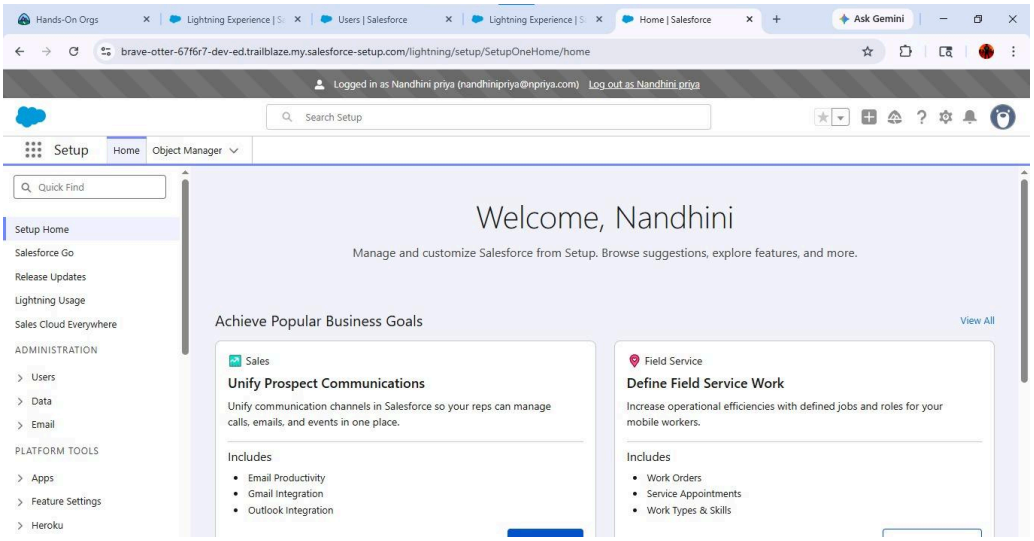
Milestone 1 : Creation of developer account and verification
Milestone 2 : Data management Object Creation
Milestone 3 : Data management -Tabs
Milestone 4 : Data management - App Manager
Milestone 5 :Fields and Relationships
Milestone 6 : Data management - Field type
Milestone 7 : Data Security - Roles
Milestone 8 : Data Security - Profiles
Milestone 9 : Data Security - Users
Milestone 10 : Data Security - Field level access
Milestone 11 : Apex class ,Triggers and Testing
Milestone 12: Automation

Step 1 : Developer account is created successfully for our team.



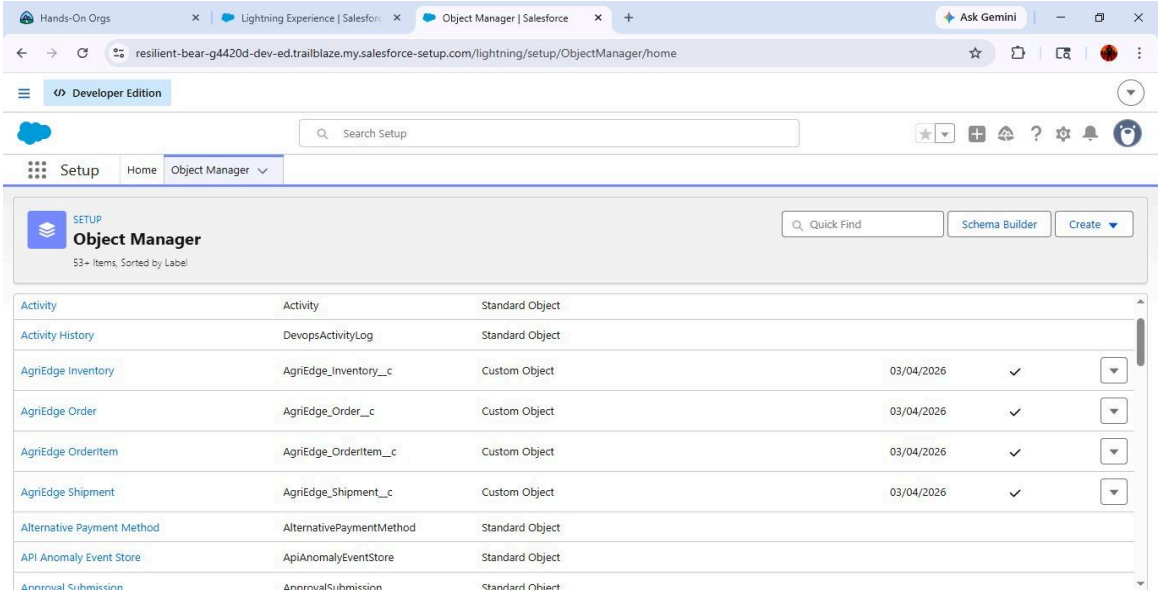
Step 2 : Account is verified and Salesforce page is screened.
Step 3 : Redirect to Salesforce Setup page .



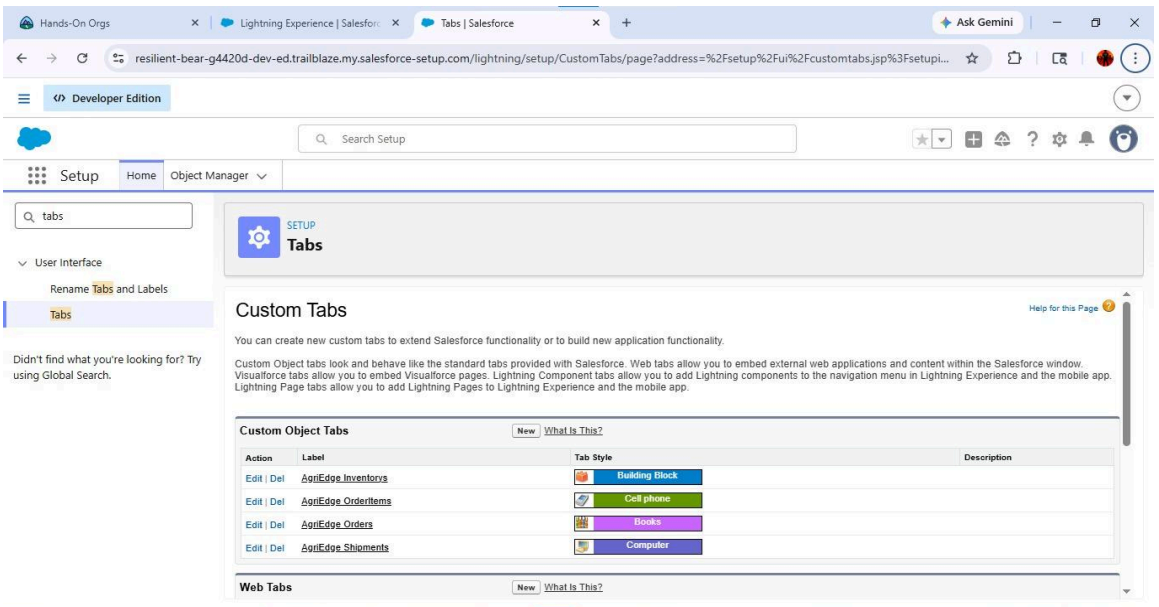


Step 4 : Creating a objects in object manager step.

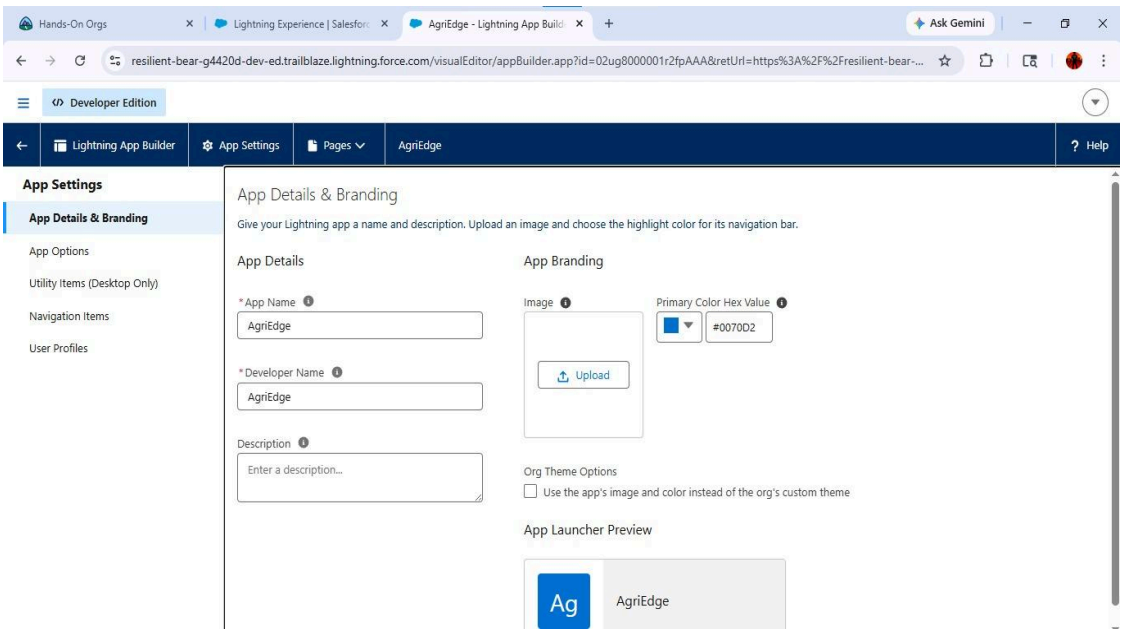
- **Agri edge order**
- **Agri edge order item**
- **Agri edge inventory**
- **Agri edge shipment**

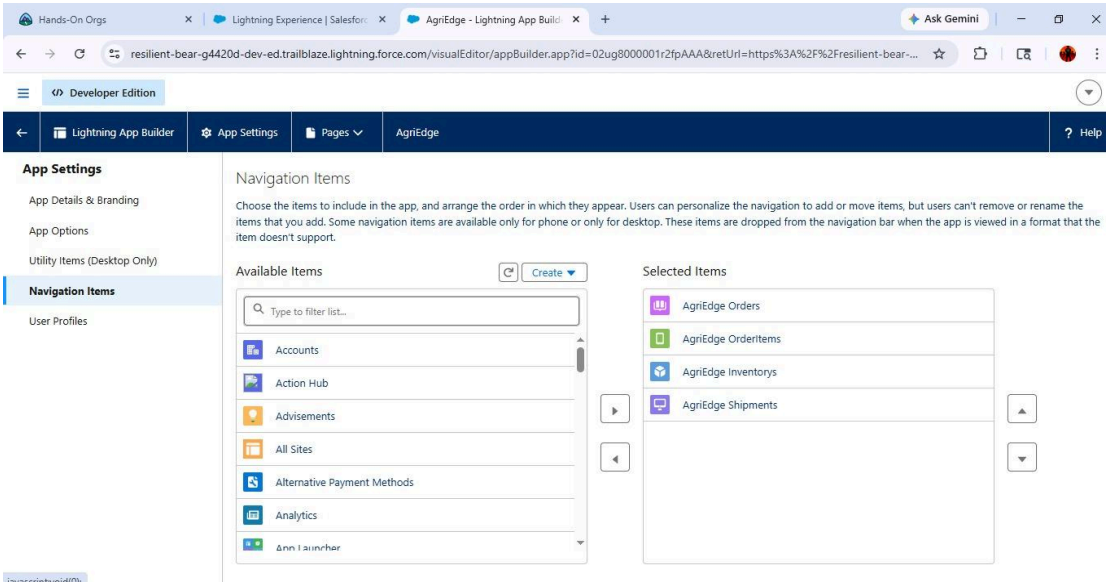


Step 5 : Tabs were created for each objects , using different tab styles.



Step 6 : App Managaer is created with Adding options and Utility items, Navigation items , User profile





Step 7 : Field and relationship where create for each objects.

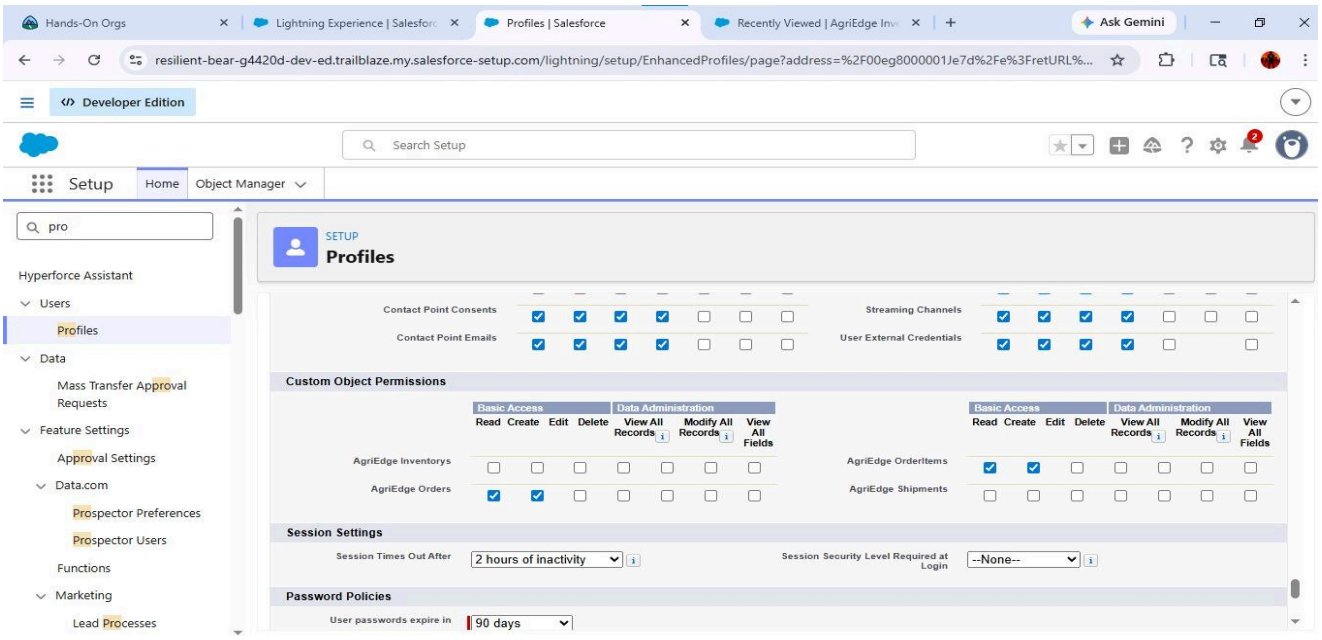
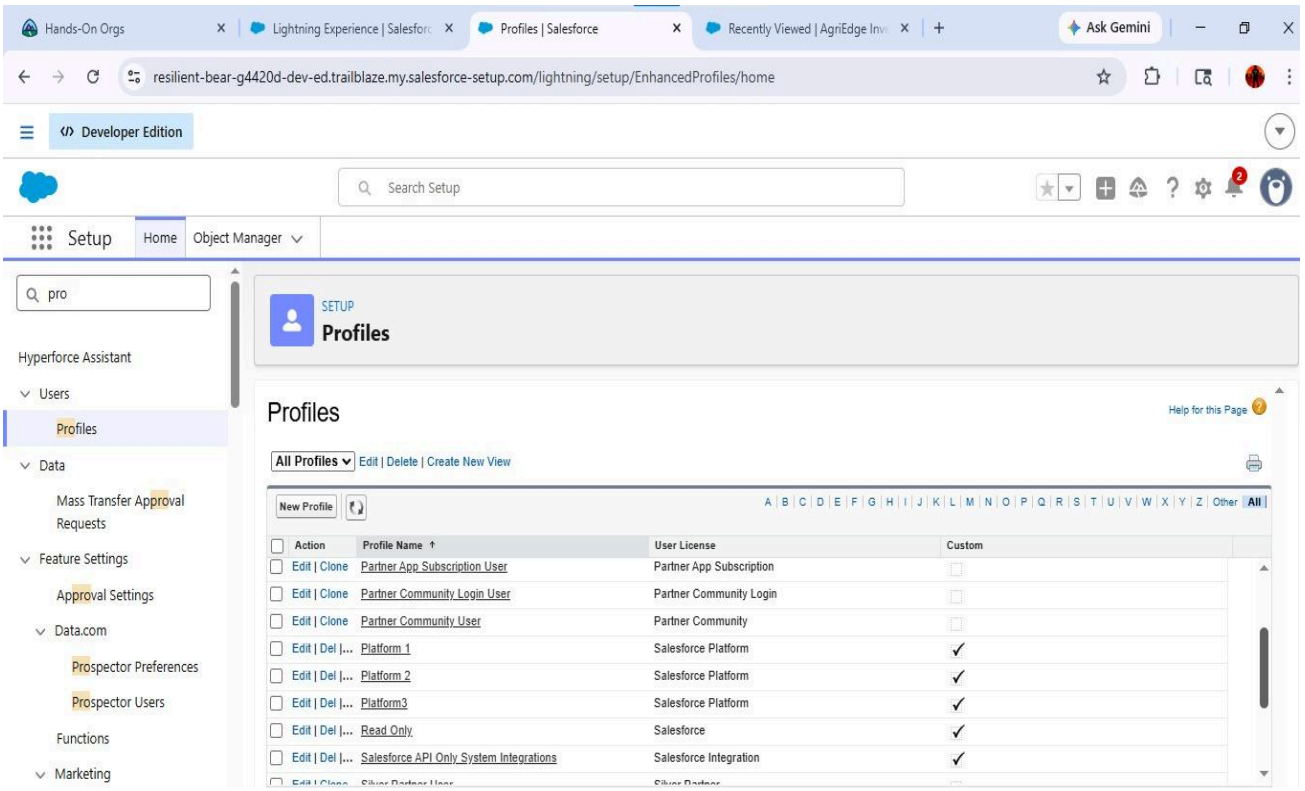
Step 11 : Profiles created

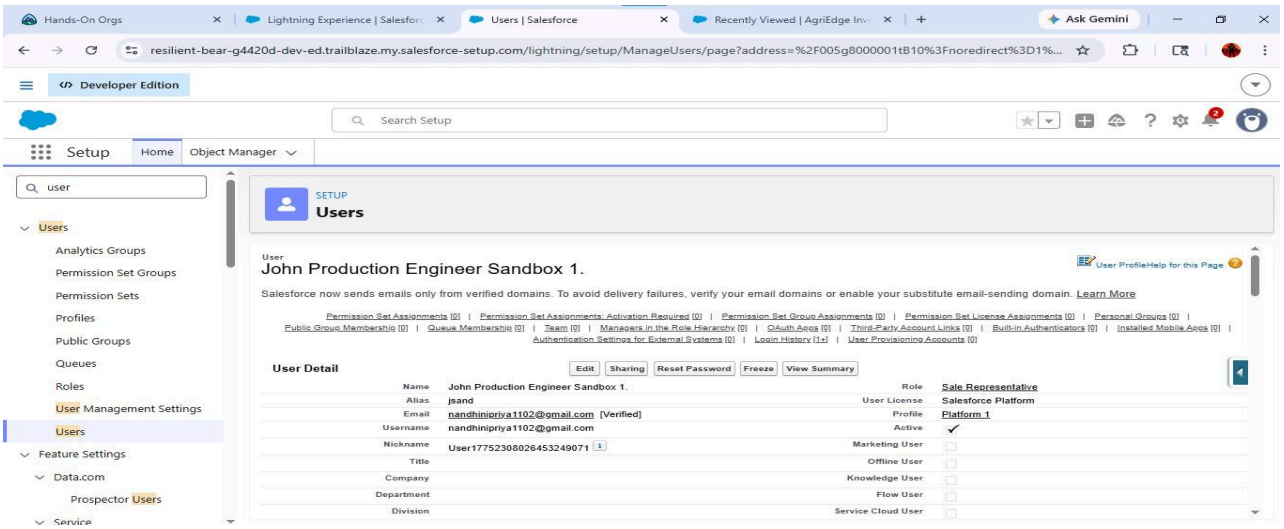
- **Platform 1**
- **Platform 2**
- **Platform 3**

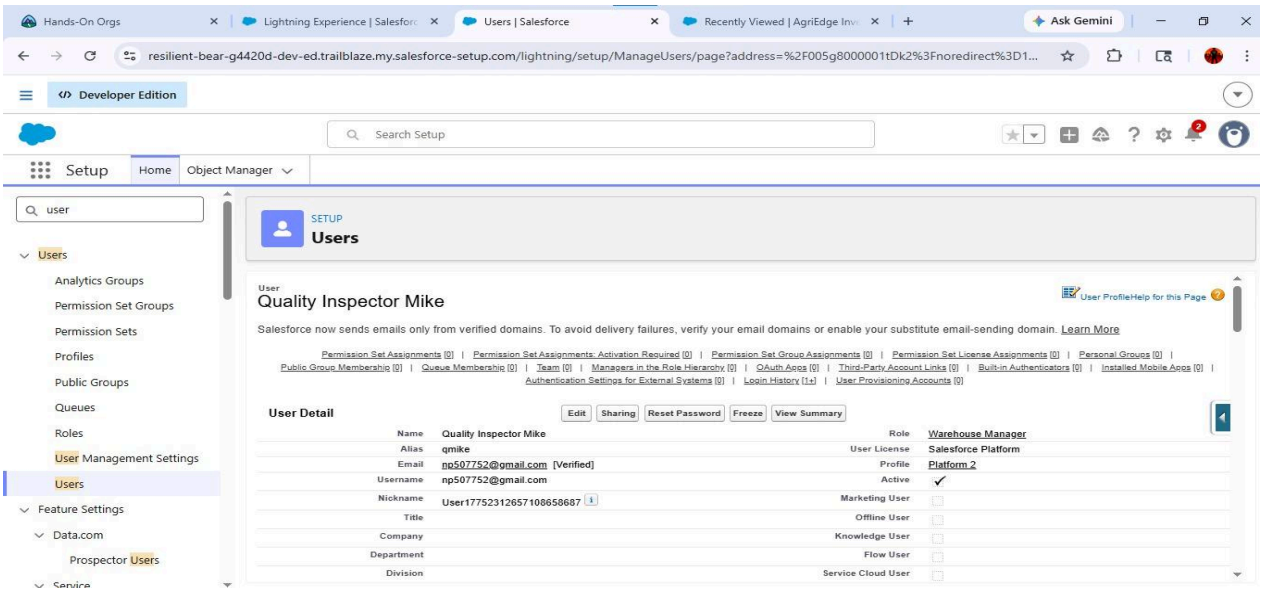


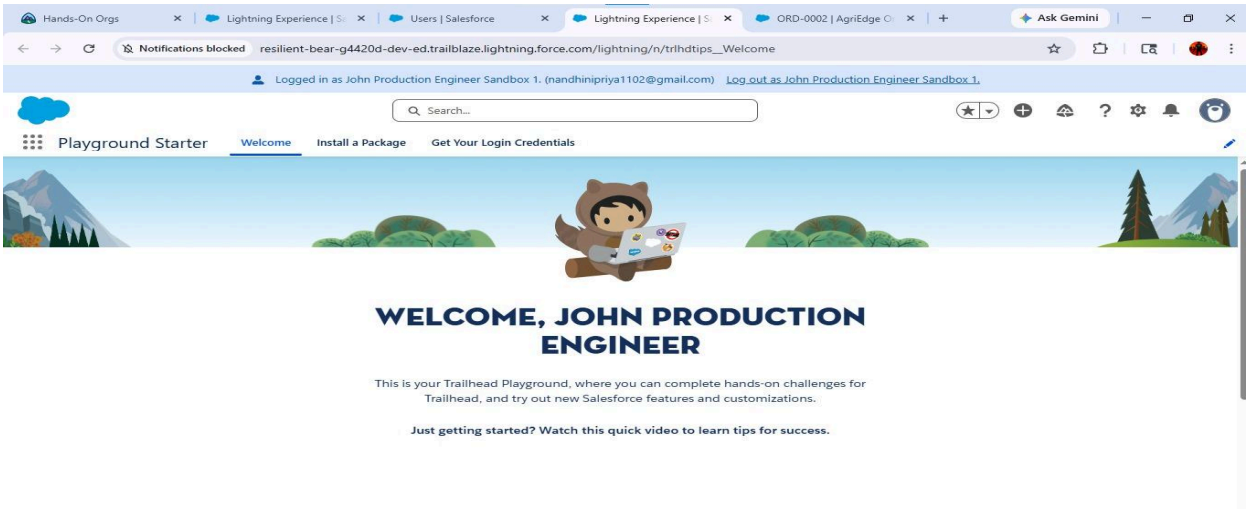


Step 12 : User Creations for Salesforce platforms 1,2,3

- **John production Engineer**
- **Quality Inspector Mike**
- **Plant Manager Albert**

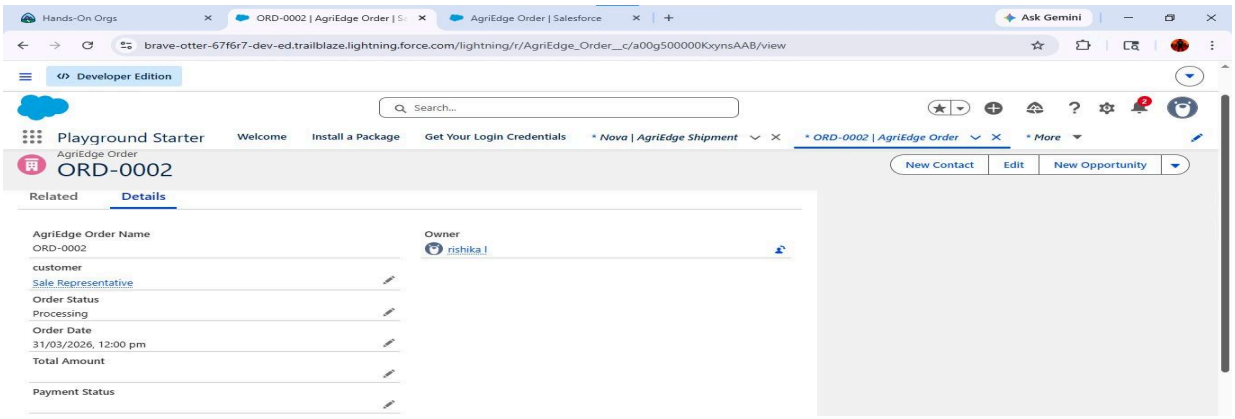


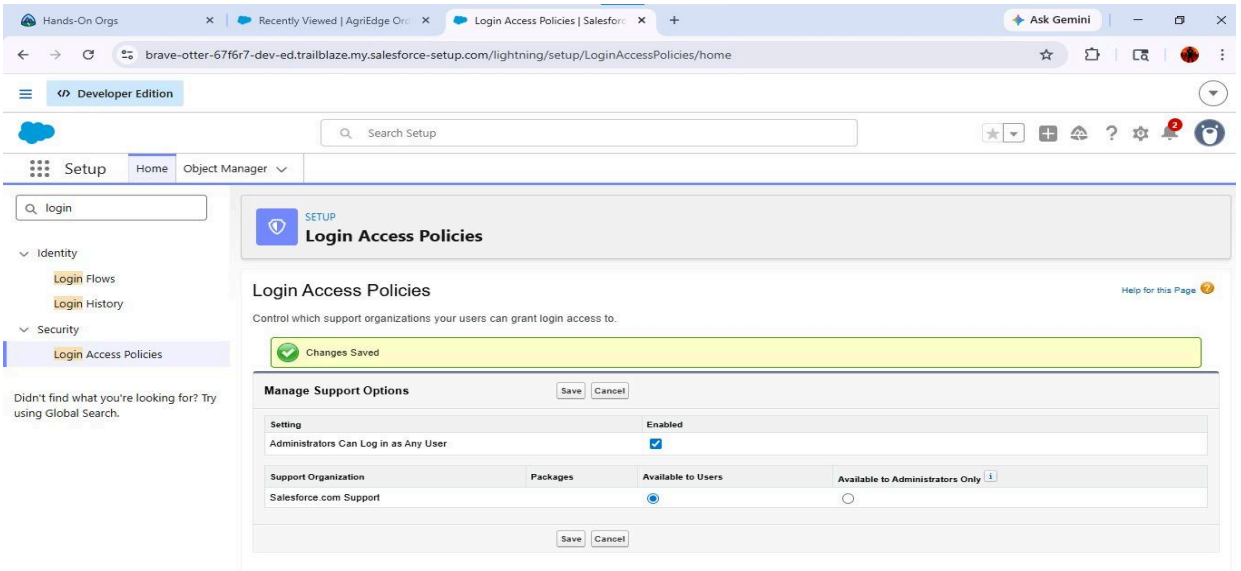




As similar , Created for other Users.

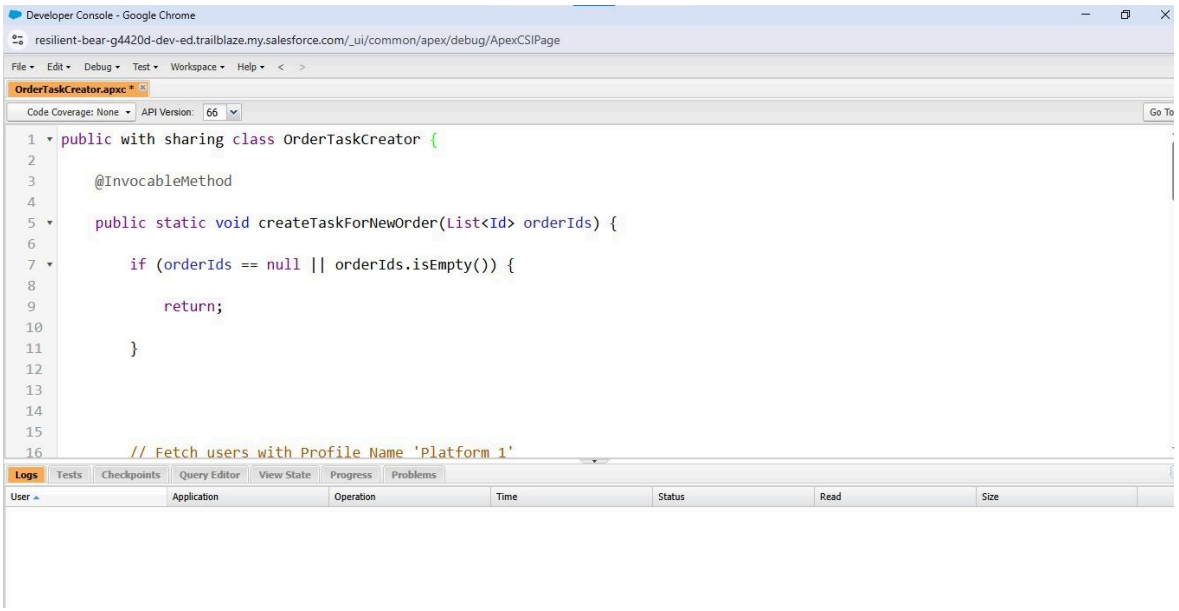
Step13 : Field level Access





Step 14 : Apex Class ,Triggers ,and Testing .

Write Specific Codes for all the creating apex classes and new trigger appex classes.



Step 1 : Create Apex class Name is Order Task Creator and Click Ok. and write particular code inside class

Step 2 : Create another Apex Trigger Handler class name is Order status Updated . Write apex class inside the class

Step 3 :Create Another Apex Class Name is OrderTotalUpdater and Click Ok Button.Inside the Apex Class Write The code

Step 4: Create Trigger Class Call Apex Class OrderStatusUpdater in Trigger.Click On File and Click New then Select Apex Trigger.

Step 5 :Create an Apex trigger.

- Name : OrderItemTrigger
- Object : AgriEdge_OrderItem__C
- Click Submit Button.Write Trigger Code Inside the Trigger Class

Step 6: Create Apex Class For Email

- Class Name : OrderEmailSender
- Click Ok Button.Inside the Class Write Apex Logic Code.

Step 7: Create an Apex Trigger

- Create Trigger Class

- Class Name : OrderPaymentStatusTriggers

- Object : AgriEdge_Order__c
- Write Code Logic Inside the Trigger

Step 8:Create Apex Class

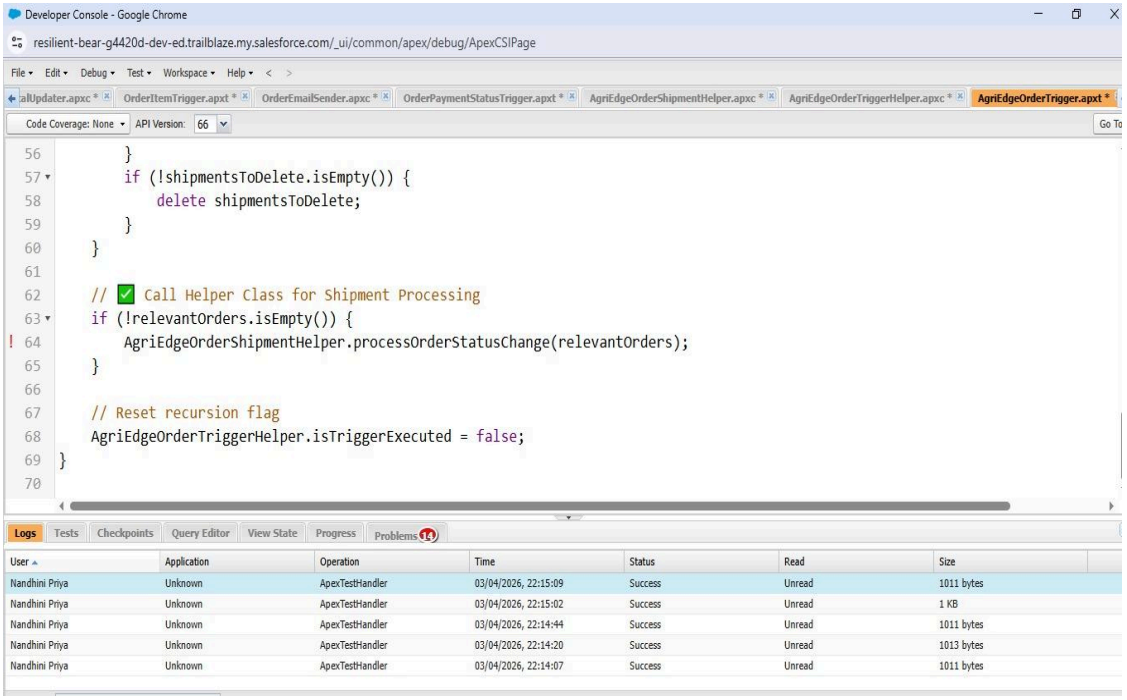
- Class Name : AgriEdgeOrderShipmentHelper
- Click Ok Button.Write Logic inSide Apex Class.

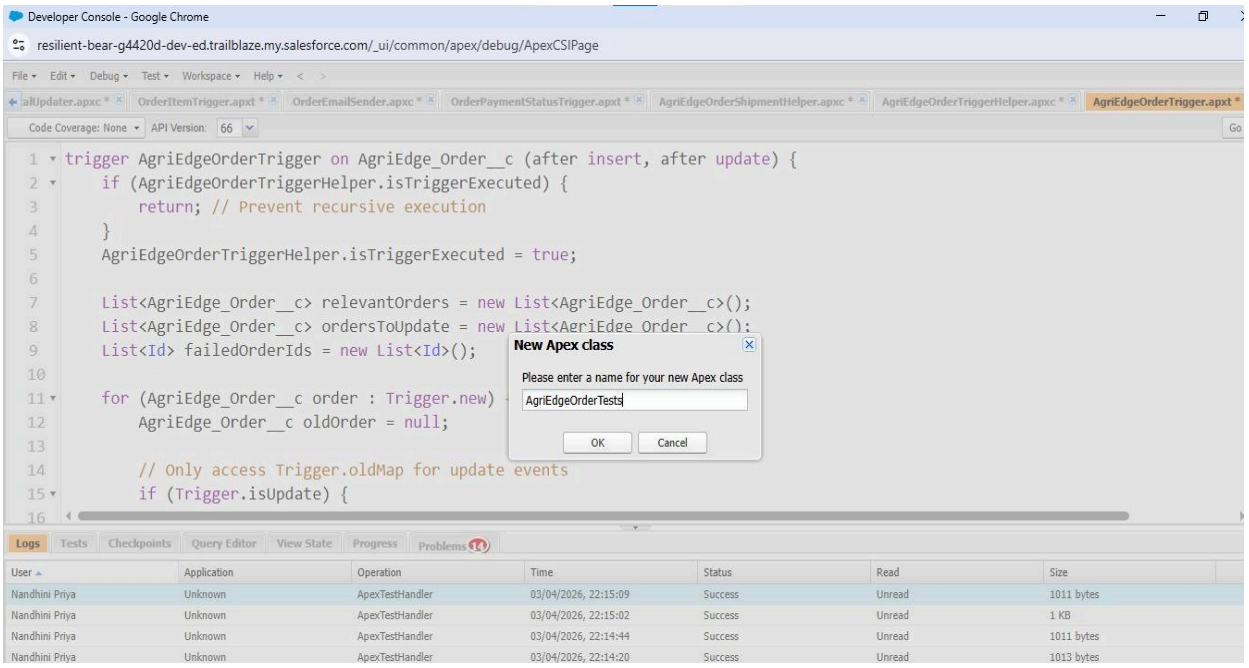
Step 9 :Create Apex Class

- Class Name : AgriEdgeOrderTriggerHelper.Click Ok Button
- Write Boolean Logic to Help In Trigger Class

Step 10 :Create Trigger Class

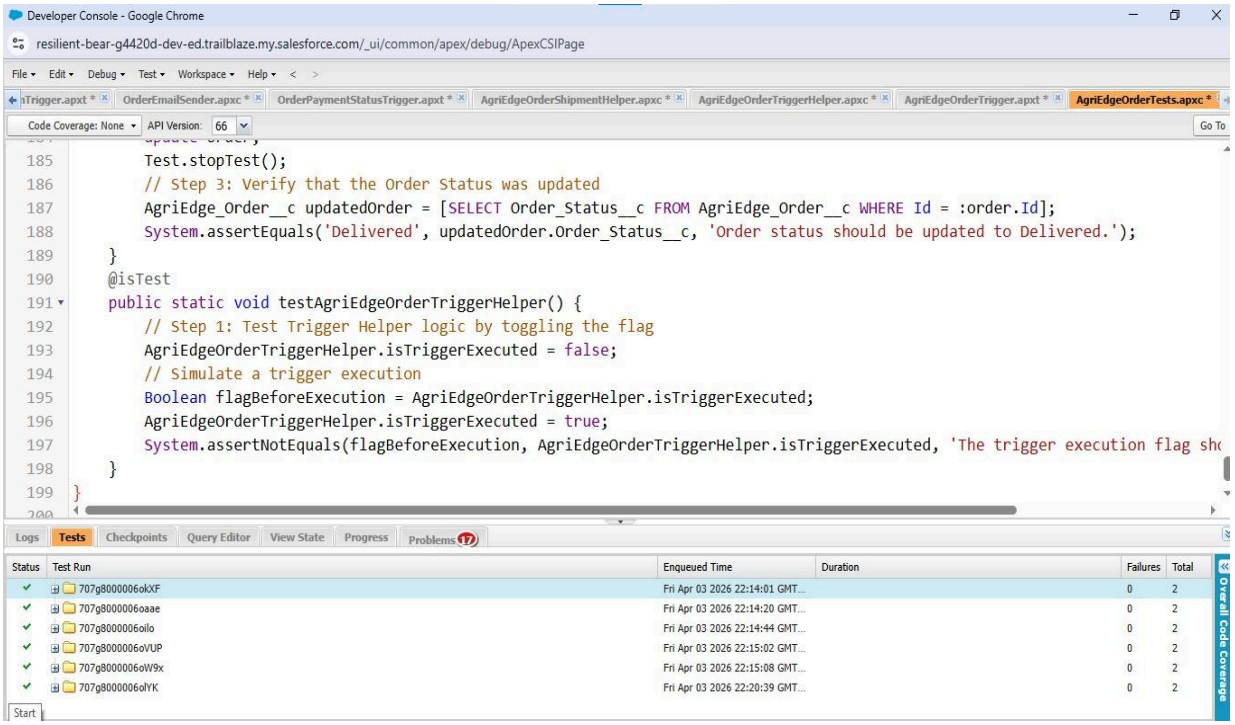
- Class Name : AgriEdgeOrderTrigger
- Object : AgriEdge_Order__c
- Create :Logic In Trigger Class





Apex Test class :

Creating Test class for All Apex class in one class .



Source code for Test class all Apex classes in One class :

```
@isTest
public class AgriEdgeOrderTests {
   @isTest
   public static void testOrderTaskCreator() {
      // Step 1: Create Test Data
      // Create an Account (not a User) as the customer
      Account testAccount = new Account(Name = 'Test Customer');
      insert testAccount;
      // Create the User for testing purposes (this is unrelated to
Customer__c)
      User testUser = new User(
         Username = 'testuser@example3454.com',
         Firstname = 'Test1',
         LastName = 'john',
         Email = 'testuser@example.com',
         Alias = 'testuser',
         ProfileId = [SELECT Id FROM Profile WHERE Name = 'Platform
1' LIMIT 1].Id,
         TimeZoneSidKey = 'America/New_York',

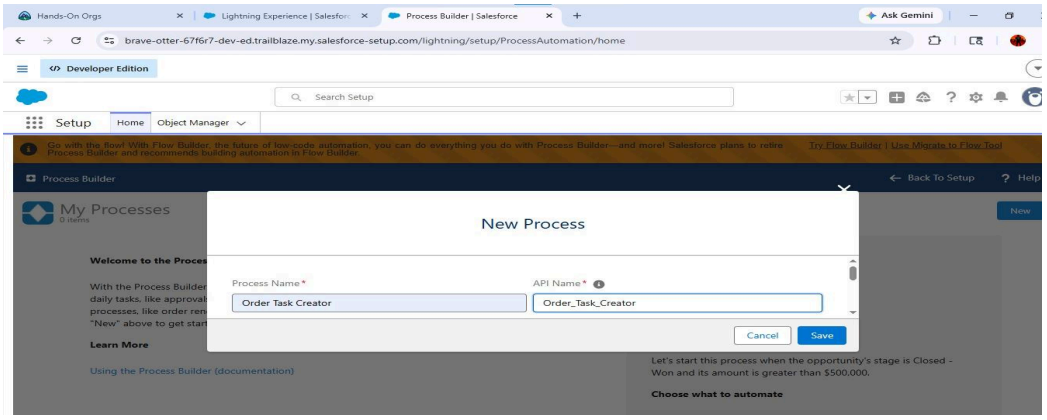
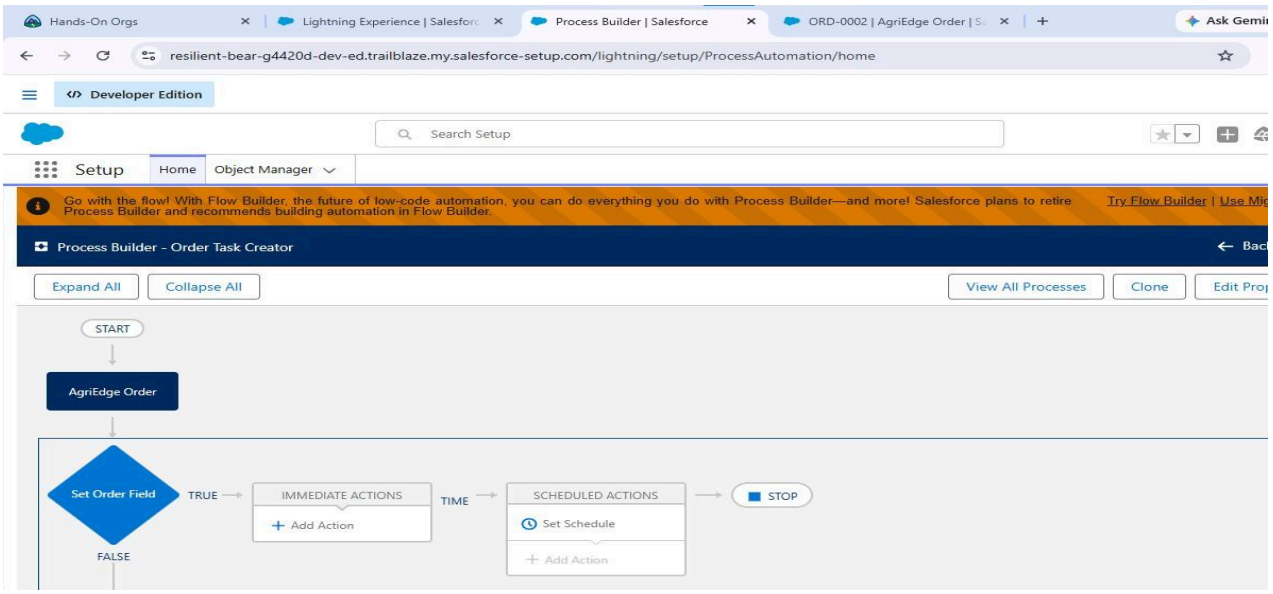
flag should be toggled.');
    }
}
```

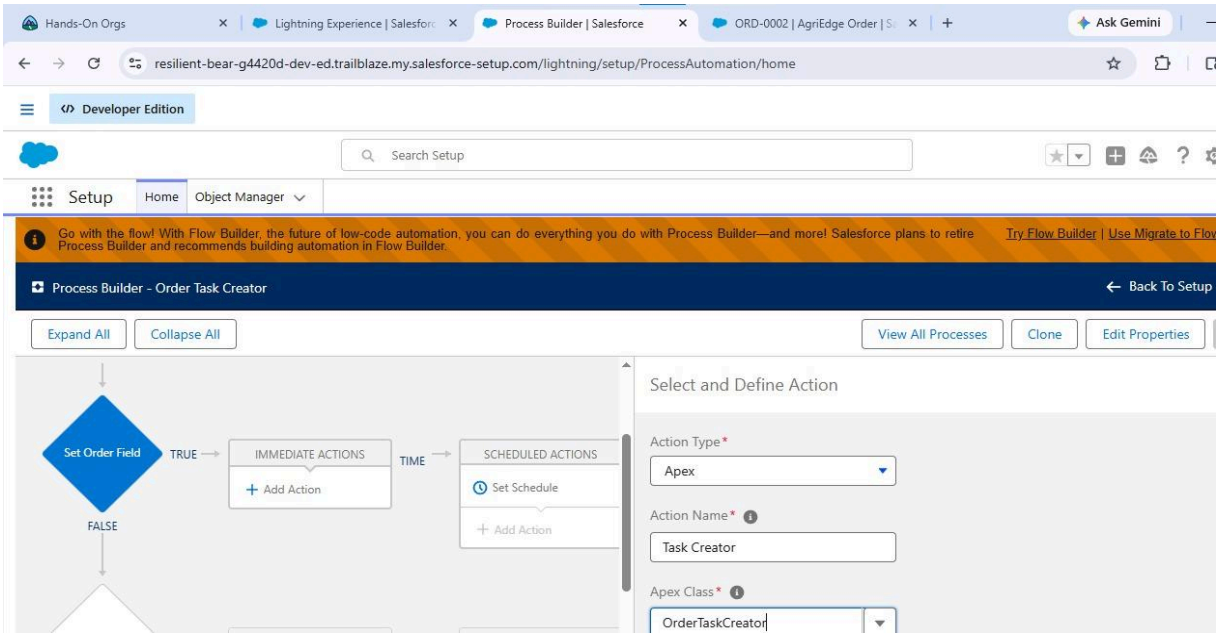
Step 15: Automation

Process Builder created to Call Apex classes.



- Object is Created.
- Criteria is added , In Immediate action (Field is Selected).
- Apex option is selected then Saved
- Finally **Activated.**





Advantages :

- Improved order accuracy and automation
- Faster order processing for farmers and distributors
- Real-time tracking of agricultural products
- Scalable cloud-based solution
- Seamless integration with third-party systems
- High customization using Salesforce platform

Disadvantages:

- Dependency on internet connectivity
- Complex customization and configuration
- Operational Challenges
- High implementation cost
- Requires skilled Salesforce professionals
- Data migration complexity.

Future Scope:

- **AI-based Demand Prediction**
  Predict crop demand and optimize supply chain
- **IoT Integration**
  Smart farming with real-time data from sensors
- **Mobile Application**
  Farmer-friendly mobile apps for order placement
- **Blockchain Integration**
  Transparent and secure agricultural transactions
- **Advanced Analytics**
  Real-time dashboards for decision-making.

Appendix :

A Tools and Technologies Used

- **Salesforce CRM –** Platform for building the Order Management System
- **Apex –** Backend programming language for business logic
- **Lightning Web Components (LWC) –** Frontend UI development

B. System Modules

- Customer Management
- Product & Inventory Management
- Order Processing Module
- Payment & Billing Module
- Reporting & Dashboard Module

C. Sample Data Used (Given in Data Description)

- Customer details (Name, Contact, Address)
- Product catalog (Seeds, Fertilizers, Equipment)
- Order records (Order ID, Quantity, Status)

D. User Roles

- Admin – Full system control
- Distributor – Manages inventory and order fulfillment
- Customer – Views and tracks orders

Conclusion:

The AgriEdge Salesforce-driven Order Management System successfully demonstrates how modern cloud technology can transform traditional agricultural practices.The project highlights the importance of automation in reducing manual errors, speeding up order processing, and providing real-time tracking of agricultural products. With the support of Salesforce features such as scalability, customization, and integration capabilities, the solution proves to be both reliable and adaptable to future needs.

In conclusion, the AgriEdge solution is a significant step toward digital agriculture, enabling smarter decision-making and improving productivity, ultimately benefiting farmers and the entire agricultural ecosystem.
